

## Copilot

Certainly! In **EJS (Embedded JavaScript)** templates, you can use conditional statements to dynamically render content based on specific conditions. Here are some ways to achieve this:

### 1. If-Else Statements:

- Use the `<% if (condition) { %>` syntax to create an if statement.
- For example, to prepend an 's' to the word 'comment' when there is more than one:

```
<%= commentsNumber %> comment<% if (commentsNumber > 1) { %>s<% } %>
```

- Ensure that the opening and closing tags (`<%` and `%>`) are correctly paired.

### 2. Ternary Operator:

- You can use a ternary operator to conditionally render content in a concise way:

```
<%= role === 'Admin' ? 'Super Admin' : role === 'subAdmin' ? 'Sub Admin' : role %>
```

### 3. Switch Case:

- If you have multiple conditions, consider using a switch case:

```
<% switch (role) {  
  case 'Admin': %>  
    Super Admin  
  <% break;  
  case 'eventAdmin': %>  
    Event Admin  
  <% break;  
  case 'subAdmin': %>  
    Sub Admin  
  <% break;  
} %>
```

Remember that EJS allows you to embed JavaScript code within HTML markup, providing flexibility for dynamic content. Choose the approach that best fits your use case! 🚀🌟
