Copilot

Certainly! When working with **EJS (Embedded JavaScript)** templates in an **Express.js** application, you can loop through an array using the following approaches:

1. **Using `forEach`**:

   - The `forEach` method allows you to iterate over each element in an array and execute a provided function for each item.
   - Example in EJS:

     ```
     <ul>
       <% myArray.forEach(function(item) { %>
         <li><%= item %></li>
       <% }); %>
     </ul>
     ```

   - Replace `myArray` with your actual array variable.

2. **Using a `for` Loop**:

   - You can use a traditional `for` loop to iterate through the array:

     ```
     <ul>
       <% for (var i = 0; i < myArray.length; i++) { %>
         <li><%= myArray[i] %></li>
       <% } %>
     </ul>
     ```

3. **Using ES6 Syntax (Arrow Function)**:

   - If your environment supports ES6, you can use arrow functions for a more concise syntax:

     ```
     <ul>
       <% myArray.forEach(item => { %>
         <li><%= item %></li>
       <% }); %>
     </ul>
     ```

Choose the method that best fits your project and coding style. Happy templating! 🚀🌟
